-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 February 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 2-31 and 34-44 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 2-31, 34-44 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claims 35-44 rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The subject matter of new claims 35-44 are not supported in the original disclosure. The disclosure does not disclose "pseudolite" and all limitations related thereto. This is new matter.

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

4. Claim 7 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 7, the applicant recites, "a maximum". It is not clear what all is meant and encompassed by "maximum".

Art Unit: 3663

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 2-9, 34 rejected under 35 U.S.C. 103(a) as being unpatentable over P. Ptasinski et al (Jounal of Navigation, 2002, chapter 55, pages 451-462) in view of Hancock (6202023).

Regarding claim 2, Ptasinski et al disclose the satellite positioning receiver (see GPS antenna, fig. 4) capable of receipt of at least three positioning signals (pages 453, 454) comprising:

a navigation processor (figs. 3&4) that processes the at least three positioning signals and determines an at least three code phases (pages 453-456); and

a location determined from initial digital terrain elevation data (pages 453-456) used to calculate a solution with the at least three code phases and an altitude equation derived from the initial digital terrain elevation data, where the solution further includes:

a horizontal error ellipse parameter (fig. 1, pages 452, 453) in the altitude equation that form an error ellipse having a major axis and a minor axis that correspond to the altitude error (figs. 1&2);

a plurality of points along the major axis and the minor axis that form a grid of grid points (figs. 1&2; pages 452, 453); and

Art Unit: 3663

a memory that contains digital terrain elevation data (altitude augmentation using digital maps, pages 454-456) the grid points.

Ptasinski disclose the points along the major axis and the minor axis, but was no quite clear about a polynomial surface fit over the points. However, Hancock teaches of a two dimensional polynomial surface fit over a grid of points (Figs. 1, 2; cols. 6, etc).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Ptasinski for the purpose of allowaing faster database searches of position (col. 4, lines 1+).

Regarding claim 3, Ptasinski et al disclose the satellite positioning receiver of claim 2, further including:

a server that receives a plurality of satellite code phases where each of the satellite code phases is associated with a satellite positioning system signal over a wireless network (ericson moble, fig. 4); and

a controller in the server accesses the initial digital terrain data in order to determine a solution (pages 455, 456)

Regarding claim 4, Ptasinski et al disclose the satellite positioning receiver of claim 2, where the initial digital terrain elevation data is retrieved from the memory in response to receipt of a signal other than the at least three positioning signals.

Regarding claim 5, Ptasinski et al disclose the satellite positioning receiver of claim 2, wherein the digital terrain elevation data in the memory is NIMA (DTED) level 0 digital mean elevation data.

Art Unit: 3663

Regarding claim 6, Ptasinski et al disclose the satellite positioning receiver of claim 2, where the digital terrain elevation data in the memory is GTOPO30 Global Elevation data.

Regarding claim 7, Ptasinski et al in view of Hancock disclose the satellite positioning receiver of claim 2, further including:

a maximum residual error in the polynomial surface fit over the grid points utilized to determine whether the error is below a predetermined threshold.

Regarding claim 8, Ptasinski et al disclose the satellite positioning receiver of claim 7, wherein, the predetermined threshold is 100 meters.

Regarding claim 9, Ptasinski et al disclose the receiver of claim 2, wherein the navigation processor is a processor located in a server.

Regarding claim 34, Ptasinski et al disclose a server (fig. 4), comprising:

- a transceiver (figs. 3&4) that receives a plurality of satellite code phases (pages 454-457);
- a memory (figs. 3&4) with digital terrain elevation data (pages 454-457); and
- a controller (figs. 3&4) that processes the plurality of code phases and accesses the digital terrain data in memory with an initial height to determine a location indicated by the plurality of satellite codes and the digital terrain data (pages 454-457);
- a message containing the location data sent from the transceiver;
- a horizontal error ellipse parameter (figs. 1&2) in an altitude equation that form an error ellipse having a major axis and a minor axis that corresponds to an altitude error about the initial height (pages 452-456); and

a plurality of points along the major axis and the minor axis that form a grid of grid points that the controller accesses the digital terrain elevation data in memory at the grid points (pages 452-457).

Ptasinski disclose the points along the major axis and the minor axis, but was no quite clear about a polynomial surface fit over the points. However, Hancock teaches of a two dimensional polynomial surface fit over a grid of points (Figs. 1, 2; cols. 6, etc).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Ptasinski for the purpose of allowaing faster database searches of position (col. 4, lines 1+).

Regarding claim 35, 37, 39, 41, 43, Ptasinski / Hancock et al disclose the satellite position receiver, wherein the solution further includes an initial height taken from a height value in the neighborhood of a pseudolite (pages 452-457).

Regarding claim 36, 38, 40, 42, 44, Ptasinski / Hancock et al disclose the satellite position receiver, wherein the pseudolite is a base station (pages 452-457).

Claim Rejections - 35 USC § 102

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

8. Claims 10-31 are rejected under 35 U.S.C. 102(b) as being anticipated by P. Ptasinski et al (Jounal of Navigation, 2002, chapter 55, pages 451-462).

Art Unit: 3663

Regarding claim 10-31, 34 are, Ptasinski et al disclose a method of determining the location of a receiver (figs. 3&4) in recipient of at least three positioning signals, comprising:

identifying a reference location (pages 452-456) with the at least three positioning signals;

retrieving an initial height (pages 452, 453);

determining an average height along with an average height error (altitude error, pages 452, etc) from the initial height (pages 452-454);

deriving at least three simultaneous equations associated with the at least three positioning signals (pages 452-456);

solving the at least three simultaneous equations (pages 452-456) with the average height and the average height error that results in a position and a corresponding horizontal error ellipse (figs. 1, 2);

fitting a two-dimensional polynomial to the corresponding horizontal error ellipse (figs. 1&2); and

solving the at least three simultaneous equations and the two dimensional polynomial that results in an altitude of the satellite positioning receiver (pages 453-456).

Regarding claim 11, Ptasinski et al disclose the method of claim 10, where determining an average height further includes:

identifying one of a minimum height and a maximum height; and setting the height error equal to the absolute value of the difference between the one of the minimum height and the maximum height and the average height.

Regarding claim 12, Ptasinski et al disclose the method of claim 10, where retrieving an initial height further includes:

transmitting a plurality of code phases to a server where each of the code phases is associated with each of the positioning signals; and

accessing digital terrain data stored in a memory to retrieve the initial height.

Regarding claim 13, Ptasinski et al disclose the method of claim 12, wherein the wireless network is a cellular communication network.

Regarding claim 14, Ptasinski et al disclose the method of claim 10, where retrieving an initial height further includes: receiving the initial height from a memory located within the satellite positioning receiver.

Regarding claim 15, Ptasinski et al disclose the method of claim 10, further include: acquiring another height using variables from the two dimensional polynomial; and comparing the difference between the other height and altitude to a predetermined threshold.

Regarding claim 16, Ptasinski et al disclose the method of claim 15, where the predetermined threshold is 100 meters.

Regarding claim 17, Ptasinski et al disclose the method of claim 10, where the receiver is located in a server.

Regarding claim 18, Ptasinski et al disclose the satellite positioning receiver apparatus (figs. 3&4) in recipient of at least three positioning signals, comprising:

means for identifying a reference location with the at least three positioning signals (pages 452-456);

means for retrieving an initial height (pages 452-456);

means for determining an average height along with an average height error from the initial height; means for deriving at least three simultaneous equations associated with the at least three positioning signals(pages 452-456);

means for solving the at least three simultaneous equations with the average height and the average height error that results in a position and a corresponding horizontal error ellipse(pages 452-456);

means for fitting a two-dimensional polynomial to the corresponding horizontal error ellipse; and

means for solving the at least three simultaneous equations and the two dimensional polynomial that results in an altitude of the satellite positioning receiver(pages 452-456).

Regarding claim 19, Ptasinski et al disclose the apparatus of claim 18, wherein the determining an average height means further includes: means for identifying one of a minimum height and a maximum height; and means for setting the height error equal to the absolute value of the difference between the one of the minimum height and the maximum height and the average height.

Regarding claim 20, Ptasinski et al disclose the apparatus of claim 18, wherein the means for retrieving an initial height further includes: means for receiving the initial height from a server located in a wireless network.

Regarding claim 21, Ptasinski et al disclose the apparatus of claim 20, wherein the wireless network is a cellular communication network.

Art Unit: 3663

Regarding claim 22, Ptasinski et al disclose the apparatus of claim 18, wherein the means for retrieving an initial height further includes: means for receiving the initial height from a memory located within the satellite positioning receiver.

Regarding claim 23, Ptasinski et al disclose the apparatus of claim 18, further including:
means for acquiring another height using variables from the two dimensional polynomial;
and means for comparing the difference between the other height and altitude to a predetermined threshold.

Regarding claim 24, Ptasinski et al disclose the apparatus of claim 23, where the predetermined threshold is 100 meters.

Regarding claim 25, Ptasinski et al disclose a machine-readable signal bearing medium (figs. 3&4) for satellite positioning receiver apparatus containing a plurality of machine-readable signals, comprising:

means (figs. 3&4) for identifying a reference location upon receipt of at least three positioning signals (pages 452-456);

means (figs. 3&4) for retrieving an initial height (altitude, pages 452-456);

means (fig. 2) for determining an average height along with an average height error from the initial height (pages 452-456);

means (figs. 3&4) for deriving at least three simultaneous equations associated with the at least three positioning signals (pages 452-456);

means (figs. 3&4) for solving the at least three simultaneous equations with the average height and the average height error that results in a position and a corresponding horizontal error ellipse (pages 452-456);

Art Unit: 3663

means (figs. 3&4) for fitting a two-dimensional polynomial to the corresponding horizontal error ellipse (pages 452-456); and

means (figs. 3&4) for solving the at least three simultaneous equations and the two dimensional polynomial that results in an altitude of the satellite positioning receiver (pages 452-456).

Regarding claim 26, Ptasinski et al disclose the machine-readable signal bearing medium of claim 25, wherein the determining an average height means further includes:

means for identifying one of a minimum height and a maximum height (pages 452-456); and

means for setting the height error equal to the absolute value of the difference between the one of the minimum height and the maximum height and the average height (pages 452-456).

Regarding claim 27, Ptasinski et al disclose the machine-readable signal bearing medium of claim 25, wherein the means for retrieving an initial height further includes: means for receiving the initial height from a server located in a wireless network.

Regarding claim 28, Ptasinski et al disclose the machine-readable signal bearing medium of claim 27, wherein the wireless network is a cellular communication network.

Regarding claim 29, Ptasinski et al disclose the machine-readable signal bearing medium of claim 25, wherein the means for retrieving an initial height further includes:

means for receiving the initial height from a memory.

Regarding claim 30, Ptasinski et al disclose the machine-readable signal bearing medium of claim 25, further including:

means for acquiring another height using variables from the two dimensional polynomial;
and

means for comparing the difference between the other height and altitude to a
predetermined threshold.

Regarding claim 31, Ptasinski et al disclose the machine-readable signal bearing medium
of claim 30, where the predetermined threshold is 100 meters.

MPEP 2114

9. In the apparatus claims, the statements of intended use or field of use, "capable of",
"determined from", "receives", "accesses", "retrieved", "calculated", "fitting", "height taken
from a height value", etc, clauses are essentially method limitations or statements of intended or
desired use. Thus, these claims as well as other statements of intended use do not serve to
patentably distinguish the claimed structure over that of the reference. See *In re Pearson*, 181
USPQ 641; *In re Yanush*, 177 USPQ 705; *In re Finsterwalder*, 168 USPQ 530; *In re Casey*, 512
USPQ 235; *In re Otto*, 136 USPQ 458; *Ex parte Masham*, 2 USPQ 2nd 1647.

See MPEP § 2114 which states:

A claim containing a "recitation with respect to the manner in which a claimed
apparatus is intended to be employed does not differentiate the claimed apparatus from the prior
art apparatus" if the prior art apparatus teaches all the structural limitations of the claim. *Ex
parte Masham*, 2 USPQ 2nd 1647

Claims directed to apparatus must be distinguished from the prior art in terms of
structure rather than functions. *In re Danly*, 120 USPQ 528, 531.

Apparatus claims cover what a device is not what a device does. *Hewlett-Packard Co. v. Bausch & Lomb Inc.*, 15 USPQ2d 1525, 1528.

As set forth in MPEP § 2115, a recitation in a claim to the material or article worked upon does not serve to limit an apparatus claim.

The prior art anticipate the structural limitations in the apparatus claims. Even if the prior art did not perform the method limitations recited in the apparatus claims, which the examiner is not conceding, it is believed that the structural arrangement in the prior art is capable of performing the method limitation recited in the apparatus claims.

Response to Arguments

10. Applicant's arguments filed 2/12/07 have been fully considered but they are not persuasive.

Applicant's argues that the term "maximum" is disclosed in the specification pages, 9, 19, etc. Applicant further argues that the term can be readily determined by one of ordinary skill in the art, but does not show how one of ordinary skill can readily determine "Maximum". It is noted that the specification does not provide a standard or suggestion on how to determine "maximum". The term is a relative term.

The applicant argues that the prior art Hancock does not teach a two dimensional polynomial surface fit over a grid of points. The examiner disagrees. Hancock discloses a two dimensional polynomial surface fit over a grid of points (Figs. 1, 2; cols. 6, etc). The drawings speak for themselves.

Art Unit: 3663

The applicant further argues that Hancock does not teach a satellite positioning system. The argument is irrelevant since the examiner did not cite Hancock as teaching or not teaching a satellite system.

Applicant's further argues that the prior art does not distinguish "fitting a two dimensional polynomial to the corresponding horizontal ellipse". The examiner disagrees. Petanski anticipates "fitting a two-dimensional polynomial to the corresponding horizontal error ellipse (figs. 1&2)". The drawings speak for themselves. The applicant misquotes the examiner in reference to "Petanski.....was not quite clear about a polynomial surface fit over a grid of points". The examiner mentioned that Petanski *disclose the points along the major axis and the minor axis*, but was not quite clear about a polynomial surface fit over the points. The quoted phrase is in claim 2. On the other hand, claim 10 recites, "fitting a two dimensional polynomial to the corresponding horizontal error ellipse". Therefore claim 10 is different from claim 2. Petanski alone anticipates claim 10, etc. On the other hand Petanski in combination with Hancock anticipates claim 2, etc.

New claims 35-44 are new matter as already rejected above.

Conclusion

11. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO

Art Unit: 3663

MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Communication

12. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ronnie Mancho whose telephone number is 571-272-6984. The examiner can normally be reached on Mon-Thurs: 9-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jack Keith can be reached on 571-272-6878. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
